

Public Risk Screen

ISS — public conjunction fixture · NORAD 25544

DECISION AUTHORITY: SCREENING_ONLY · MODE: PUBLIC_SCREEN
This is a public-data screen. It is not an underwriting determination and must not be used to bind coverage.

OPERATOR / TYPE	REGIME
NASA, Roscosmos, ESA, JAXA, CSA / space_station	LEO
NEXT HUMAN ACTION	GENERATED
request_telemetry	2026-08-12T00:00:00+00:00

Operator power, thermal, and attitude telemetry is required before any health or underwriting conclusion.

COLLISION PROBABILITY

Computed Pc = **0.01074398255212092** (foster_akella_alfriend_2d; HBR 20.0 m; TCA 2026-06-01T12:34:56.789).

EVIDENCE LEDGER

Class	Status	Why it matters
Operator telemetry	missing	Power, thermal, attitude, command, and anomaly telemetry are required before underwriting conclusions.
Calibrated imagery	missing	Imagery needs range, scale, calibration, and image-quality metadata before physical damage dimensions are defensible.
Camera and range metadata	missing	Focal length, sensor pitch, GSD/range, pose, illumination, and scale reference are missing or incomplete.
Spacecraft geometry	missing	Mass, projected area, subsystem geometry, materials, and exposed components are required for exposure modeling.
Shielding and materials	missing	Shielding depth and material stackups are required for MMOD/radiation vulnerability estimates.
Covariance/CDM quality	present	Buyer-supplied CDM accepted; Pc computed with foster_akella_alfriend_2d.
Operator anomaly logs	missing	Private anomaly, maintenance, and operations logs are required to connect public observations to spacecraft health.
Actuarial priors	missing	Validated fleet loss priors, policy context, and claims history are required for loss probability and financial exposure.

BLOCKED CLAIMS

- financial_exposure_without_policy_or_operator_financials

- physical_damage_dimensions_without_calibrated_imagery
- power_impact_without_telemetry_or_measurement_chain
- total_loss_probability_without_actuarial_model
- underwriting_recommendation_without_private_evidence

VISUAL FINDINGS (UNCALIBRATED)

- **debris_strike** (SEVERE): Significant structural puncture and substrate tearing in the central region of the solar array blanket. The damage involves loss of multiple photovoltaic cell segments and exposure of the underlying support matrix. Dimensions cannot be determined without calibrated scale reference.

SUMMARY

Public Risk Screen result; screening-only authority. This pack lists what public evidence shows, what is missing, and what a human should request next. It is not an underwriting or bind decision.
